Hi all,
I am working with SQLite3 in my application, using U++ plugin.
For allow some workstations to share a common database on my network, I found an ODBC project for SQLite3, that it's also working fine, but, (reading it's web page) don't work with UTF-8 charset.

In fact after insert data in the database connected via ODBC and next read again, the resulting data are unusable.

There is some ways for use different charset with the database ? (My project is using UTF-8), or I must use an encoder/decoder for all these data?

Thanks.
