Does this sound redundant? From a U++ newbie's point of view (in this case myself), what I would like is to install and try compile and run an app in a few clicks. So, I create a test directory, run the wizard to create a bare bone console app in the test directory and build. I would also like to try out all the bare bone apps like: with U++, without U++, GUI, and so on. Just to try. I would expect the wizard to do the setup for me.

Wouldn't it be much easier to have a hands-on step by step guide for the above mentioned purpose? As I notice from my experience and those hinted in the forum, a write-up on this would be of great help to the many potential newbies out there.

If I throw in an initial, how would I start? I mean where can I put the initial write-up to have a presence on the net or for the community? Any suggestions?

Thanks and regards to whomever this may concern.
