How to use multiple windows on my project (using layout)?
How to add tab controls? Why tab controls are not graphical in a layout?

Thanks

I think multiple windows are quite good described in GUI tutorial.

How to add tab controls?

Create layouts for each sub-dlg, create Ctrls for them and add them to the layout.

If things are simple, as in e.g. ide/Environment (just TabCtrl and couple of buttons make the dialog), you can use TabDlg to simplify the task (see reference/TabDlg).

Why tab controls are not graphical in a layout?

Because more than single layout is involved.
