Subject: UppHub / Plugin directory

Hello,

After reading the UppHub instractions here https://www.ultimatepp.org/appideUppHub_en-us.html, It says all packages have to be root or in Plugin directory

I would like to have a directory in which all addons specific to my package would be grouped (instead of beeing mixed with all others in the plugin directory).
This enhances readability a lot

Is there a real reason for restriction about Plugin directory ?

Is there a real reason for restriction about Plugin directory ?

No. The wording there should be changed. I think the really important bits are:

- do not mix packages in single UppHub nest that are solving different problems (like mixing SysInfo with STEM4U).
- try to make sure the package names that are to be used are unique (obvious reasons) - does not apply the name of examples, tests and other main packages that come with nest.
- if you are adapting 3rd party code (or perhaps format), consider putting it to plugin (like plugin/md).
- put examples into examples directory
- put U++ style tests (those that can be be compiled / run automatically and fail with non-zero exit, e.g. with ASSERT) into autotest directory
- put other tests to test

Mirek

Thank you Mirek,

it's clear now
