ok I am not quite up to understanding the full consequences of the above conversation. However, the bit (excuse the pun) that interests me is:

how many bits does an "int" have when I compile on a 64 bit OS (linux or vista - I am trying both)?

If I want my documents to load and save (using Serialize(Stream&)) between 32 and 64 bit implementations of my software, do I need to replace all "int" with "int32"? I am guessing this is so but what else will I need to change please?

char is still 16 bit right?

float is always 32 bit right?

double is always 64 bit right?

what about bool?

what about String?

Nick
