Hi all,
I'm new here. Just a question: is there a way to mapping a button (maked by layout desiger) with the code? Can anyone describe me the necessary steps?
Thanks in advance,
Pasquale.

Pasquale,

You might take a look at the "Button" example.

The difference with what you are looking for is that the button is added via the layout designer.

It is about the same:
- Do not declare the button as a class member,
- But use the button with the name defined in the layout designer.

Hope this help,
Victor

Victor
Do not forget to enter that name into layout...
