Core/SMTP is basically older SmtpMail from Web package, refactored to use the new TcpSocket. Doing so, it was easy to add support for SMTPS (SMTP over SSL), which made SmtpMail compatible with Gmail, as demonstrated by reference/SMTP example.

Could you please remove Core/smtp (lower case "smtp") from repository? It prevents from updating of source code on Windows because of SMTP (upper case). The latest "working" revision is 4844.

TIA
