I am afraid this is not really consistent with the rest of U++ handling of charsets.

The problem is that you always convert to Utf8. I think we should rather convert to active default encoding (which usually IS UTF-8, but this is how things work and in fact, some of my application depend on it).

I also think the we should have 'W' variant (returning WString) first, then 'String' variant with conversion - that will cost nothing....
