The english translation seems to be missing for this tooltip in the image editor:

Another thing: Alt-Backspace, Ctrl-Insert, Shift-Insert, Shift-Delete alternative hotkeys for Undo and clipboard operations are also missing in the image editor.

Grayscaling an image which is already grayscale should leave it as it is, but instead the image editor lightens it.

Why does the image area flicker when I scroll it with high magnification? Is it possible that a FULLBACKPAINT setting is missing?

I also find the auto-saving feature problematic: it is quite counter-intuitive that when I modify the image, the file is immediately modified. I would rather like to manually save the file when I want to. This way I would be able to discard my changes withouth saving. This is the de-facto standard operation. (I also don't like that source code is auto-saved when I switch/close tabs.)

Image editor is scheduled for complete rewrite (because, at least, it seriously needs alpha-channel support).

I will start working on new Draw/Image just after next release - 602 (I hope beta will be coming this weekend).

Another issue I found with the image editor (using the latest snapshot 20060123) is that Ctrl+T not always work to switch to text edit mode.
