Hi

Samsung bada is a new open platform that enables a richer user experience in applications on Samsung mobile devices. The bada API is not perfect but... it's very cool. I tested their OS and it is responsive.

When I begun with Ultimate++, I thought that it was possible for it to become the new Qt/Gtk/Java for Linux, Windows, OS X and that it will run on all Linux smart-phones.

Won't you like an open source crossplatform API like bada API?
Bada is proprietary.
