Hello all

I would like to use void Ctrl::Show(bool) method in layout designer. It would be necessary to change it to return Ctrl&.

What do you think?

I would like to use void Ctrl::Show(bool) method in layout designer. It would be necessary to change it to return Ctrl&.

What do you think?

Currently it returns void, right? I guess there should not be a problem if chaining is enabled. It should not break any existing code and it might make our life bit easier... IMHO it makes sense to have a possibility to hide a widget by default directly from layout editor

Just a note: If this change is made then also Hide() should return &Ctrl for consistency...

Best regards,
Honza
