Last week I engaged my full time for this project but still there are a bundle of errors with me ().

I will try to send one-by-one of those. First thing is in the following configuration:

```
Section "InputDevice"
Identifier "PenMount"
Driver "penmount"           ==> The module name: - penmount_drv.so
                               - penmount_drv.la
Option "Protocol" "PM9000"
Option "Device" "/dev/ttyS3"
.....
.....
```

In the device option what should be in my case? my device is an USB device and how to pick which event?? Event0 to 6 is there.

Siddiquee
