---

PostgreSQL doesn't accept 0, 1 as boolean values.

Extract from PostgreSQL manual:

Valid literal values for the "true" state are:

TRUE

't'

'true'

'y'

'yes'

'1'

For the "false" state, the following values can be used:

FALSE

'f'

'false'

'n'

'no'

'0'

For now, I've to define a Convert for Option.

Thank you, Mirek.
