Subject: POSIX debugging of console apps improved

When debugging a console apps in Linux, ide now launches separate console for the application to provide its input/output (while communicating with gdb using different path).

Note that some versions of gdb report

&"warning: GDB: Failed to set controlling terminal: Operation not permitted\n"

in the console. This seems to be a bug in gdb (just google it...) and is basically harmless, everything else seems to be working just fine.

HI Mirek,

a few #defines missing.
Rev. 6684 does not compile in Win7 with TDM-GCC (and I assume on Windows in general).

Attached is a patch that fixes compile and link errors.

Regards
Matthias
