Hi,
I use sqlite . I tried to use two sqls. one to read a table.. another sql to write another table.
I use fetch to get rows one by one for sql1.

However, fetch keeps resetting or losing its position as I used the second sql
(for second sql I try to create it from another session , that did help..)

How do you do this without fetch?  Or how can I use two independent sql so they can fetch independently and not avoid influencing each other.

a.

NO problem... It worked...even with just two sqls with the same session.
No problem with fetches.
It was a program bug.
I still wonder what is the problem with fetches?  and what should be the replacement?

I have no longer have a problem. Just asking.

I read here that you mirek does not advice using fetches.
What do you suggest using instead of them?
