I have a TopWindow that will call a child TopWindow with a GridCtrl inside. When I open the child window sometimes the left mouse button does not respond, I can only use the mouse right click to select the row, the mouse left click does not respond. This may happen randomly. When I close and re-open the child window again, the left mouse work again. Does anyone has this problem and has some solution. Thanks

Danny

Could you post a test case here?

Attached is one of the child window code. The application is under development and use my local server to store the MySql database (inside a local LAN) that is not available over the internet so I cannot sent you the application.

I go back 9251 and comply again and the application works without any problems. The problems only exist in 10862 and 10940. I switch from 9251 because 9251 has problem when comply with resource.rc that I cannot embed an icon and file information in the final window exe file. Thnaks.

I create a new package for testing and the GridCtrl is ok. That is the Upp is good, may be some of my previous code has bugs that is not compatible with the latest UPP version. I am now re-creating the application from fresh. Thanks for your reply.
