I agree with a lot of the things stated above.

But, not including all the excellent contributions from the community, I have the feeling that development from the core team has started slowing down or is about to slow down. and rightfully so: U++ seems to me like nearing completion. There are very few new features that one can add and every project like this has a point where additional features start to serve specific needs better than general needs. Sure, one could improve the debugger, especially for Linux, but that won't change U++. It is just a convenience. Sure, more documentation could be written, but what we have is more than enough and new documentation will probably be written by volunteers. There are some bugs here and there, but no show stoppers.

While I could think of a few more features that could improve U++, I really don't need any one of them personally. U++ is more than good enough and right now I have a balanced relation with it, where it does what I need without me tweaking it. I think that there are other people that feel like this.

But it would be interesting to see what Mirek thinks? Are we just about done? Or in phase of small incremental improvements? Or do you have some huge plans for the near future? JPEG2000 ?
