coolman wrote on Thu, 27 January 2011 10:27Hi,

I have a problem with the IDE, which still goes into the forefront when I start compiling the program and minimize the IDE or run another program. This includes the debugging of programs under development.

IDE version 3084, Fedora 14, i686

This problem does not appear in the version 2929.

Radek
Hi Radek,

I'm not sure if it is a new problem, as I experience this (or similar) annoying behavior for quite a long time (I'm quite certain that it is longer than from 2929). Maybe some change occurred recently in your desktop environment settings, that just made it visible?

For me the problem is that theide "pops up" when compilation is finished and when breakpoint is hit during the debugging. The most disturbing part is that if I happen to work on different virtual desktop then theide runs at, I am abruptly taken back to the desktop where theide is.

I think this behavior should be changed or made configurable... Good compromise would be probably just to notify the user by blinking taskbar item (as many IM apps do when message is received; it should be possible both on Linux and win), what do you think?

Best regards,
Honza
