Hello Daniel

Actual implementation is:

```
bool GridCtrl::IsRowEditable(int r)
```

```
{  
    if(r < 0)  
        r = curpos.y;  
    else  
        r += fixed_rows;  
  
    return vitems[r].editable && hitems[curpos.x].editable;  
}
```

I have found possible to call IsRowEditable() with r = -1 and curpos.y = -1, so an exception is thrown because of vitems[-1].

May you check this case in the function?
