It would be perhaps possible to provide some simplification, using Jsonize for Xmlize, but not vice-versa.

BTW, there are now JsonizeBySerialize and XmlizeBySerialize. So we are perhaps speaking about XmlizeByJsonize, right? Hello Mirek

I agree. However it seems ...izeBySerialize functions serve for jsonizing and xmlizing raw data. In our case the resulting XML or Json String would be the same, but using basically only one ...ize method per class and another method per Json, XML or Serialize.

Yep, not totally same, but quite similar.

Mirek
