Here's a an example of what I mean:

Type:

if

and press Ctrl+SPACE (or any other shortcut) and the IDE inserts:

```
[CODE  
if ( _ ) {  
  
}  
][[/CODE]
```

\_ is the cursor.

Besides this the user can define something like this in the IDE:

```
Quote:if($1) {  
$2  
}
```

This can be a template for the if command configured in the IDE. \$1 and \$2 indicates where the cursor goes first and allows you to alternate between these places with some shortcut like Ctrl+J or something.

What do you think?
