Theide would be open with a big project loaded. Lots of files and lots of packages. I would have been typing and compiling and running and then suspend the session for the next. When I open the laptop the next day and click on theide on the taskbar to de-minimize the window, there is a popup with a red icon. The caption is "Error - KDialog" and the text is : Fatal Error. Invalid Memory Access. When I click ok theide closes.
