A screenshot of a terminal window titled "upp - bash - 80x24". The terminal shows the output of a compilation process. It lists several object files (.a) and their corresponding paths in the .cache directory. The linker (ld) issues a warning about an obsolete option -s and an unknown option -O. Clang reports an error: "linker command failed with exit code 1 (use -v to see invocation)". The make process then fails with "make: *** [umk] Error 1". The terminal also shows errors from the ./install script, stating "No such file or directory" for lines 70 and 71. The final message is "Something went wrong. Please use make to compile theide and/or notify developers." The last line of the terminal output is highlighted in green.

```
.a \
.cache/upp.out/plugin/lzma/GCC-Gcc-Linux-Posix-Shared/lz
ma.a \
.cache/upp.out/plugin/lz4/GCC-Gcc-Linux-Posix-Shared/lz4
