Happy New Year 2011 erevybody,

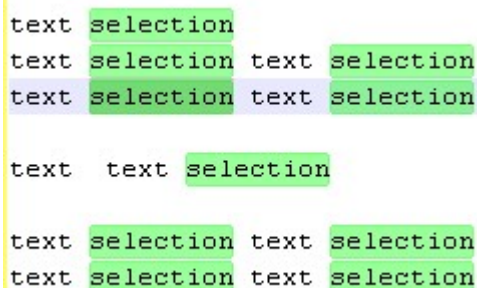

I want to select text with a particular geometric form (rounded rectangle) with different fill color.

How to do?

Thank you

The image shows a screenshot of a text editor with the word 'selection' highlighted in green rounded rectangles. The highlights are arranged in a grid-like pattern: the first row has one highlight, the second and third rows have two highlights each, the fourth row has one highlight, and the fifth and sixth rows have two highlights each. The word 'text' is placed to the left of each 'selection' highlight.

LineEdit or DocEdit are not particulary well suited for this.

Hi,

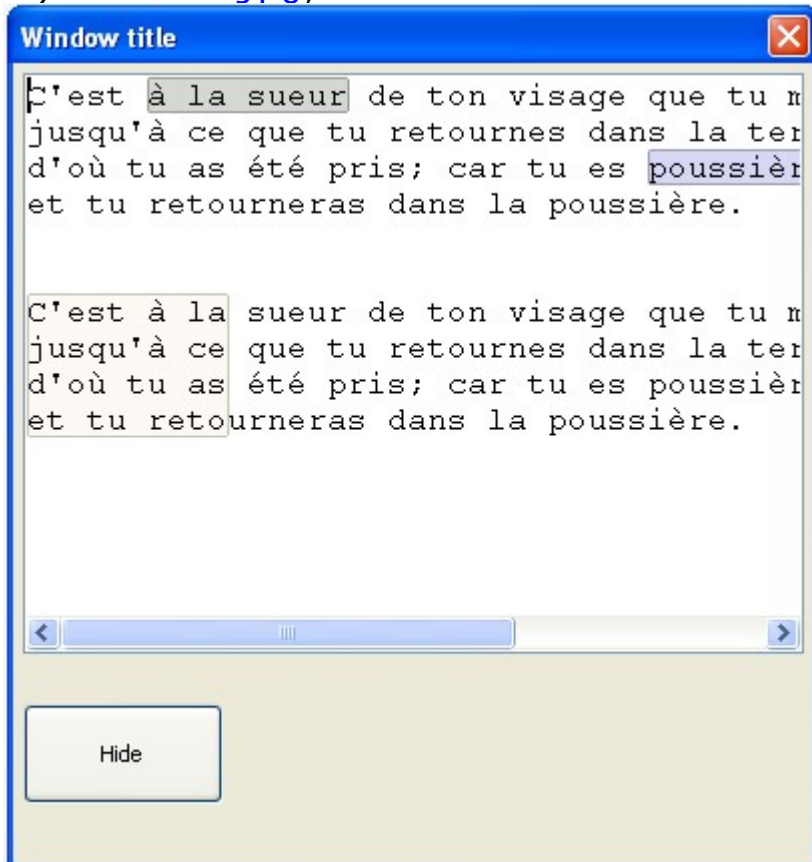

I have a little suggestion for LineEdit Ctrl to realize special selection.

Here is an example i developed on Windows platform.

I suppose I can do more complex selection form and fonctionnality using mouse events and keys.

That looks quite interesting. Especially block selection can be very powerful tool, if the related functionality (clipboard operations, deleting, find&replace, etc...) is well implemented. It would be very nice to have it e.g. in theide (as the editor is LineEdit based).

Hi,

I submit you here a functionality that is usefull:

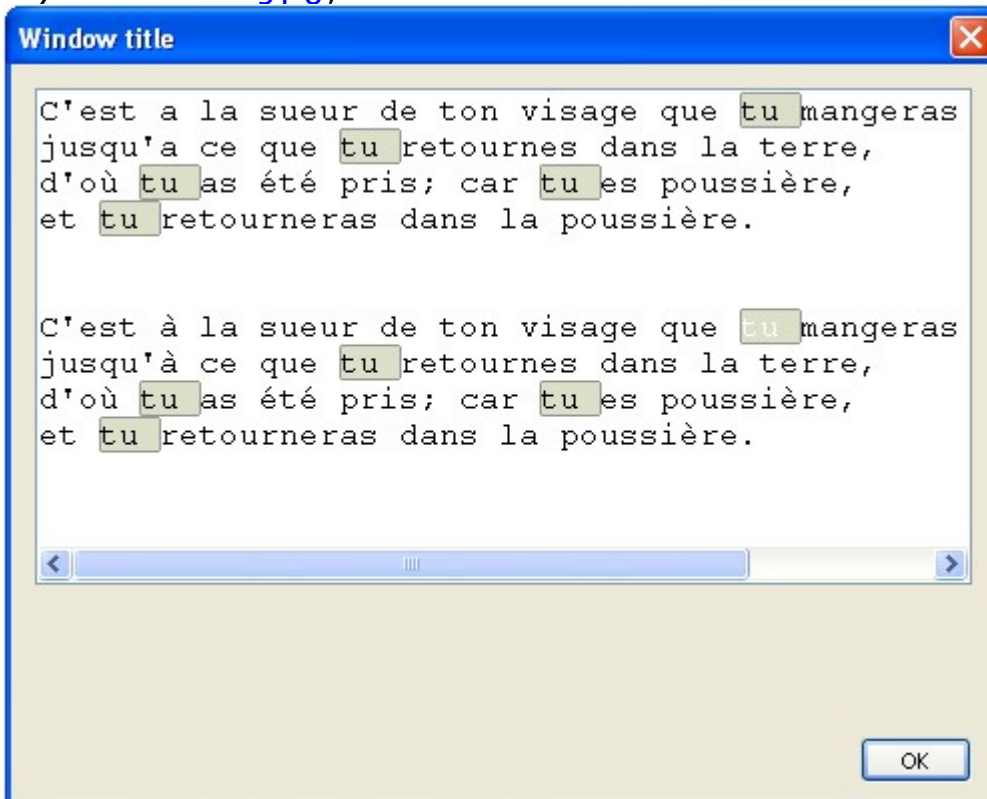

you doubleclick a word and the ctrl mark all occurrence of that word.

Next part will coming soon, block selection implementation

That looks very promising. I can't wait to try block selection. If you could implement inserting/removing chars in all block rows simultaneously as you type (like in UltraEdit for example) that would be really great. Anyway good job

Indeed, good job and that will definitely be useful.

Another nice editor which you can get inspiration from: Programmer's Notepad.

It's based on Scintilla, and makes use of those kind of features (multi-column selection, multi-paste) and implements test clips, text templates, python scripting interface and much, much more.

The videos on the developer's blog are worth watching to understand what I mean.

Keep up the effort, and thanks!

Lionel

Hi everybody,

I submit here a new version of the advanced LineEditCtrl.

How to do:

Push ALT key, and press left mouse button, move mouse anywhere and leave mouse button.

I don't get select implementation as i want for the moment. It just marks a block very well with a caret at the end.

At line number 679 of AdvLineEdit.cpp, i must add function to select words into the block AND SO activate all menu of contextual bar.

Do someone have an idea!!

The main problem is to keep selected words that will activate bar functions (Copy CTRL+C, CUT

CTRL+X, ...):

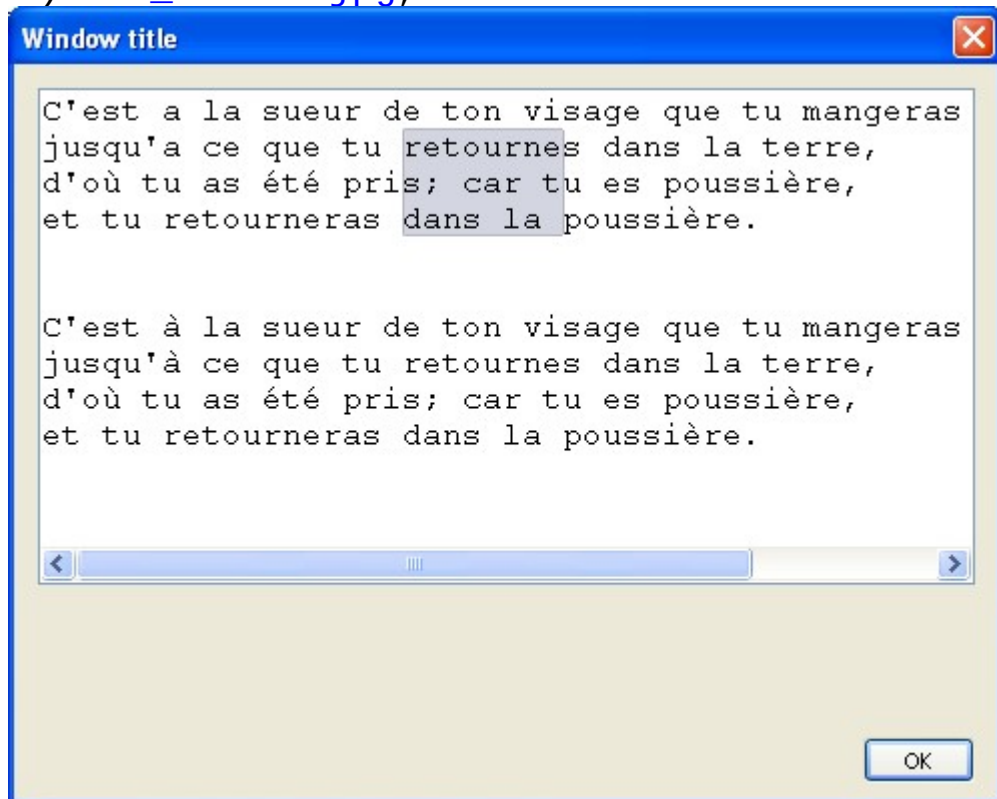

- what variable is used to keep selected words
- what variable I must switch on (boolean?)

Thanks,

Ratah

How do you deal with tabs?

Ok, I do not think about it!
I suppose the problem affects only the caret placement.
I will do correction soonly.

Good weekend
