Hi,

I need a MDNS implementation on UPP, but for that I'd need udp sockets with multicast capabilities.

Has somebody done some work on it already, or shall I need to start from scratch ? (hopefully not...)

Ciao

Max

Last time I was using UDP sockets, I have found them so simple as not even worth encapsulating... :)

See bazaar/urr

Almost right ;)
I'll make a small class just to take off the (few) platform-dependent stuffs, and then port the MDNS

Hi,
Try this UdpClient/UdpServer classes .

I have used it in an app that does not need the Multicast.

Hi, thank you ;)
I've made my own udp class which supports multicast.
I'm finishing MDNS implementation, then I'll post it.

Ciao

Max

He,

here a couple of packages that may be useful... maybe I could add to Bazaar later.

The MDNS packages contains:

- a non-blocking udp class, IGMP capable
- a simple (and probably incomplete...) MDNS client/server for discovering and publishing services
with Bonjour protocol
- a couple of classes for IPV4 and IPV6 addresses
- a nice function to enumerate all network interfaces and their IP

The MDNSTest package is a simple testing application that can detect Arduino boards that use
Bonjour protocol
All is tested on windows and linux. I'll check it on Mac too on next days.

Ciao

Max
