TextCtrl is just a common base for DocEdit and LineEdit, it does not work alone.

Alright then - works.

I tried a RichTextCtrl, but it refuses to become editable.
Also it uses a huge font, which I try to override like so:

```
dlg.method.SetQTF("[=2 " + recipetable.Get(0, 4).ToString() + "]);  
dlg.method.SetEditable(true);  
dlg.method.ClearModify();
```

But all that is being ignored.
Well, DocEdit works for me. So it's all good for now.

I have attached screenshots of my app's main window and the dialog in question.
Left side are the sqlite database views.
Right side is the chosen recipe composed into RichTextView.
It's a cooking recipe database, if you haven't figured.

Guido
