bonami wrote on Thu, 28 June 2007 06:01in this way, the library is linked statically.
i put the program in another machine without dll and it runs ok.

Is that complaint or praise?

Note that this depends on two things:

- first, if .lib just represents .dll, it is linked as shared, if it represents static library, it is linked static.

- if there are both forms (.a and .so on Linux) of library available, the result depends on "All static" vs "Use shared libraries" settings.
