---

here's the case,

i have an EZCommon library, and an EZComm using it.  
under nonGUI linux, it is a .so and a executable.

in upp (IDE), i'm puzzeld by the notions of assebly and package.

now i've got a default MyApp assembly and created two packages EZCommon and EZcomm.

EZCommon generates a .dll now.

if they don't contain each other, linkage fails. if EZCommon contains EZComm, EZCommon is not linked as a dynamic .dll.

i set the option using shared libs. it runs well on another machine, so .dll is not used.

what shall i do
