change exe's function to use dll's class,

```
GUI_APP_MAIN
```

```
{  
    ezcommwin ezcw;  
    ezoi i;
```

```
    i.mem();  
    ezcw.Run();  
}
```

and exe still runs without dll. and build does not generate a dll. thus, package inclusion does not yield any linkage, if you set "use shared libs". if i set "all shared" build complians sth. failure in iml. i think i should not include ezcommon package, but must add it as a library through package organizer. it now fails in lineage and i still have not yet figured out where to put dll. system32 seems not working.
