I think I've seen this before and it was discussed some place before in the forums -- just not sure when or where...

What happened to me was somehow the debugger got the source code <in the upper right package window of theide> and another pointer to it in <prj-aux>. The breakpoints were being set in <prj-aux> and the debugger was looking for them in the project code. Try setting them in both and see if that helps.

Then again I may be completely off in left field.
