Subject: Re: how to link a .dll?
Posted by bonami on Thu, 05 Jul 2007 02:07:23 GMT

OK. i downloaded impdef and now have .def. but MinGW doc says nothing more of how to use this .def.
i added a library option from U++'s package management, giving the full path of .dll. then bing! it links. and tested on other machine, complaining no .dll found.
but what puzzles me is that after i renamed my .dll, it still runs well on my machine.
if this is ok, i do not need any .def or anything.
