Well, this is what I was suggesting, was not I

yes, you were. Just reaffirming the point.

Quote:

linking against .obj file corresponding to \*.iccp would be acceptable solution since it does not rely on specific VC++ extensions.

I do not get this. What extensions?

Mirek

If \*.iccp file compiled into the library (as a regular cpp) the linker will drop the object code from them since they are not referenced inside the library itself.

theIDE has a work around for this, but to make it work with other IDE's one would have to use non-standard extensions to force the linker to reference the code in iccp file. Snapshot for VS2005 attached. (Is it not?)

Another approach is to link with \*.obj files corresponding to \*.iccp with the target executable....
