theIDE with .lay and other files so double
click in VS would start up as the editor?

Well, this is what I was suggesting, was not I

yes, you were. Just reafirming the point.

linking against .obj file corresponding to *.iccp would be
acceptable solution since it does not rely on specific VC++
extensions.

I do not get this. What extensions?

Mirek

If *.iccp file compiled into the library (as a regular cpp) the
linker will drop the object code from them since they are not
referenced inside the library itself.

theIDE has a work around for this, but to make it work with
other IDE's one would have to use non-standard extensions to
force the linker to reference the code in iccp file. Snapshot
for VS2005 attached. (Is it not?)

Another approach is to link with *.obj files corresponding to
*.iccp with the target executable....
