Thanks.

BTW, it might be good to update ConfigFile() as well for Windows to be more compliant with Windows path used for application.

Instead of using the EXE directory.

```
return GetExeDirFile(file);
```

We can store config file in the "Application Data" Windows directory that belong to the user.

```
String p = GetHomeDirFile("Application Data\\" + GetExeTitle());
```

```
static bool b;
```

```
if(!b) {
```

```
    RealizeDirectory(p);
```

```
    b = true;
```

```
}
```

```
return AppendFileName(p, file);
```

Regards,

Benoit
