CUDA is NVidia's API for writing programmes which use the GPU for calculations. Anyone with a GeForce 8800 or better should be able to use this API.

Unfortunately though all the examples are written for VC++ and they also need to be compiled with a special compiler (nvcc.exe) and tinkering with this sort of stuff is not in my comfort zone so am wondering if anyone else on here has had a play and got it working?

If you want to find out more about CUDA you can go here

[](http://developer.nvidia.com/object/cuda.html) [](http://developer.nvidia.com/object/cuda.html)

where there are lots of cool free toys to download and play with as well as guides to what the hell they are. Ok, back to being befuddled for me....

Nick
