Hello,

I found a bug in Crypo/Sha1::Put() function.

You don't have the same hash if you put all your buffer in one call or if you put the last 1 to 63 bytes in another call.

The line code while(length >= 64) should be while((pos+length) >= 64), and the last lines memcpy(buffer, s, length); pos = length; should be memcpy(buffer+pos, s, length); pos += length;

Regards.
