\\MyApps\\Project\\trunk\\

is very likely not what you want.

Keep your package in classic

\\MyApps\\Project\\

Then on SVN repository feel free to create

/...anything.../Project/trunk

(and tags and branches and under branches some branch directories, etc...)

Than don't check out whole /....../Project tree from SVN, but only the /....../Project/trunk subtree into the \\MyApps\\Project\\ directory.

So you get rid of the "trunk" in MyApps.

Keep experimenting with SVN on some unimportant data and in testing repository, check the free book about using SVN.

And take your time! It's easy to do checkout, commit and update, but to learn when/why to branch, when to merge, and WHEN to commit, that's lot more complex stuff and it does require some experience and some thinking about how SVN works, and how you can benefit from it.
