thx... i have looked through the sources.. but i still have no clue how to use SlaveProcess...
Somehow it gives me An error all the time, becuae Slave process is pure virtual, although il am
using "StartLocalProcess" and such stuff... I must admit: I have no clue, how SlaveProcess works
^^.

What would i need to do to achieve something like this with UPP:

```
FILE pipe=_popen("gnuplot.exe","w"); //start process
```

```
fprintf(pipe,"plot sin(x) \n"); //execute command in remote process  
fflush(pipe);
```

```
_pclose(pipe);
```

greetings, Tom
