P.S. is there a portable way to get a key from console (only key, without Enter)? Like _getch()?

No.

Quote:
P.S.2 String (UTF-8) seems to be the native U++ representation of text. Is WString used / recommended to be used for anything
besides Unicode OS API calls?

The fundamental problem of UTF-8 encoded strings is that you cannot easily address individual characters. E.g. GUI editors use WString.
