- Sql::Begin and SqlSession::Begin now perform ClearErrors (there was inherent problem if before Sql there were some ignored errors; in that case OkCommit failed to commit the transaction because of these errors that happened outside transaction block).

- new method

```
void Sql::Get(Fields fo);
```

so that if you want to get record structure, you can still use parameter-less Fetch, good if you just want to load some table into memory:

```
Array<S_MYTABLE> m;  
Sql sql  
sql * Select(S_MYTABLE()).From(MYTABLE);  
while(sql.Fetch()) {  
    sql.Get(m.Add());  
}
```

(actually, the remaining problem in this case is creation of S_MYTABLE() temporary in select, but that is IMO just minor issue).
