Actually, nobody cares about explicitly defining '&' keys - let U++ runtime generate them for you... and perhaps do it manually in cases when you do not like automatic assignment. You can also assign only some and let U++ do the rest.

And it seems it does quite a good job assigning the keys. But is still wish it would respect my explicitly assigned position, because a have "Zoom &In" and "Zoom &Out" and I would like to keep the "_"s aligned. But this little detail won't make me think less of U++, and I must admit that I'm impressed.

You can, just do not expect U++ to check your assignments (yet?

Or at least I need a Window menu which allows you to switch between all your open documents.

See examples/UWord
