Quote:See examples/UWord

Thanks, that served as a quick fix. I don't like the multiple windows but this way I don't have to worry about multiple documents in the same instance of the main window.

Quote:I see thanks. (ops)

If you don't have time, maybe I could find some time in weekend to look over the code, maybe find a way to fix this.

Regarding that drop down panel control, I managed to create one. It works well enough for the time being, even though the code is rough, functionality is missing and it has problems with auto sizing. But it gets me going, so it's a good thing. I can imagine a custom Bar component which would accept such controls as children and automatically align them vertically one under the other as their size change.

I attached the control's source. I don't have any experience in writing U++ controls, so maybe I get some feedback. And I couldn't find a centralized place where position or size change is handled (except WndSetPos, but that is OS dependent).
