GridCtrl and ArrayCtrl are similar controls in that they provide a spreadsheet-like view into rows and columns of data.
Consequently, I think there's an advantage in making sure their functions are named similarly, as someone may elect to switch between them (in fact, I switched from an ArrayCtrl to a GridCtrl recently in my work).
GridCtrl::IsSelected and ArrayCtrl::IsSelect are just close enough to being the same that it seems a shame not to make the names match.
IsSelect is not grammaticaly correct I was trying to follow ArrayCtrl interface, but there is too much differences now and there will be more in the future (new outstanding gridctrl is comming)
But in cases like IsSelect I agree that they could be the same. The only problem is : what to choose?
