make sure to use a more permissive validation scheme. And what is RTL anyway?

Right-to-left language like hebrew.

Quote:
Then I don't understand how can you insert values 280-230 into a 8 bit fixed character length format.

You cannot and you are not doing that. You are creating WString and then converting it to String, using default encoding, which you have set to UTF-8.

In UTF-8, 230-280 gets converted to two byte sequences.

Quote:
 Are they translated to some code page?

ToString/ToWString uses default encoding ("default charset").
