ATM, using "Compiler options".

In Setup-Build Methods-Optimize for xxxx, i suppose ?
I did so and it works.

Quote:

Well, it is a warning - means package A is using B and B is using A. Not a healthy situation....

Practical consequences are not that serious - the most important is that this way, "All shared" build fails (dynamic libraries require well defined dependency chain).

Well, that's strange, because the libs I'm importing in TheIDE are usually built as shared modules....

Another question : I've got some .cxx files that must *not* be compiled directly, but are included by #include into other files (I know, it's awful way of coding, but so they did it..).... There's a way to tell TheIDE to not compile them, even if are listed on .upp ?

Thanx

Max
