Mindtraveller wrote on Sun, 30 September 2007 15:43Got ButtonOption control on my layout.
Say, it`s called stopButton.
I want to make it disabled (grayed and not responding to user input).

None of this:

 stopButton.SetEditable(false);
 stopButton.SetReadOnly();

worked.

How to make ButtonOption disabled?

P.S. Looked into sources:
void ButtonOption::LeftDown(Point, dword) {
 push = true;
 Refresh();
} And it seems like there`s no checking for enabled/disabled state.

It does not need to check because disabled widgets do not get events.

stopButton.Disable();
