
Subject: Crash on LoadFromFile

Proceeding with U++ usage led me to another strange moment, which I couldn't solve with docs&forum search.

Loading config in a closest to examples manner, crashes application with assert in debug mode:

May be I'm doing something wrong, but I don't see any difference between my code and docs-how-it's-done-right:

```
#define CONFIG_FILE "config."
```

```
struct Config
```

```
{  
    wxBaud  baud;  
    wxParity parity;  
    int     com;  
    int     wordlen;  
    int     stopbits;  
    int     addr;
```

```
void Serialize(Stream& s)
```

```
{  
    s.Put(&baud, sizeof(baud));  
    s.Put(&parity, sizeof(parity));  
    s % com % wordlen % stopbits % addr;  
}  
};
```

```
Config config;
```

```
void Kran::LoadAndInit()
```

```
{  
    if (!LoadFromFile(config, ConfigFile(CONFIG_FILE)))  
    {  
        config.baud    = wxBAUD_38400;  
        config.com      = 1;  
        config.parity   = wxPARITY_NONE;  
        config.wordlen  = 8;  
        config.stopbits = 1;  
        config.addr     = 1;  
    }  
}
```

This code causes assertion in LoadFromFile.

Could you please help with this?
