Mindtraveller wrote on Sun, 30 September 2007 21:54 Proceeding with U++ usage led me to another strange moment, which I couldn't solve with docs&forum search.

Loading config in a closest to examples manner, crashes application with assert in debug mode:

May be I'm doing something wrong, but I don't see any difference between my code and docs-how-it's-done-right:

```
#define CONFIG_FILE "config."
```

```
struct Config
```

```
{
    wxBaud  baud;
    wxParity parity;
    int     com;
    int     wordlen;
    int     stopbits;
    int     addr;
```

```
void Serialize(Stream& s)
```

```
{
    s.Put(&baud, sizeof(baud));
    s.Put(&parity, sizeof(parity));
    s % com % wordlen % stopbits % addr;
}
};
```

```
Config config;
```

```
void Kran::LoadAndInit()
```

```
{
    if (!LoadFromFile(config, ConfigFile(CONFIG_FILE)))
    {
        config.baud    = wxBAUD_38400;
        config.com     = 1;
        config.parity  = wxPARITY_NONE;
        config.wordlen = 8;
        config.stopbits = 1;
        config.addr    = 1;
    }
}
```

This code causes assertion in LoadFromFile.

Could you please help with this?

You cannot Put (in Serialize) when LoadFromFile...

The issue is a little bit complex, but the quick fix is to use SerializeRaw instead of Put (that will provide raw binary load if loading and raw binary write if storing).
