But how would this work? What you suggest (working out correct size based on children) implies some sort of additional layout logic that is not currently possible.

Personally I think SetMinSize makes perfect sense for ParentCtrl. Why should it be different from TopWindow?

You're the boss though

Edit: Incidentally, the expandable container frame I have just posted (here) is the reason for the previous posts. Currently it is necessary to explicitly give the size of the ParentCtrl when adding it to the frame because there is no reliable way of guessing.
