ulrich wrote on Tue, 09 October 2007 16:41I put a printf inside the overrided Key function to show which key was pressed and the keycode triggered by the event.

On my Linux box, only system keys have up/down events fired when a key is pressed. From your suggestion - I wondered if it was an OS issue. I tried the same thing on my WinXP box and sure enough, all the keys received up/down events.

Any idea how to get this to work under Linux?

Well, might be a bug/"underdevelopment" (or perhaps it is not just possible in linux). Could zip and post your testing package please? (if only to speedup investigation process).
